```

Get the Data

In [ ]:
```
ratings = pd.read_csv("/tf/data/ratings.csv")
users = pd.read_csv("/tf/data/users.csv")
items = pd.read_csv("/tf/data/items.csv")
```

In [15]:
```
# ratings = pd.read_csv("/tf/notebooks/data/data/ratings.csv")
# users = pd.read_csv("/tf/notebooks/data/data/users.csv")
# items = pd.read_csv("/tf/notebooks/data/data/items.csv")
```

About the Data

In [21]:
```
ratings.columns.tolist()
```

Out[21]:
```
['user_id', 'movie_id', 'rating', 'unix_timestamp']
```

In [16]:
```
ratings.head()
```

Out[16]:

	user_id	movie_id	rating	unix_timestamp
0	196	242	3	881250949
1	186	302	3	891717742
2	22	377	1	878887116
3	244	51	2	880606923
4	166	346	1	886397596

In [27]:
```
#items.head()
```

In [28]:
```
#users.head()
```

Let us build a basic model

In [29]:
```
from recoflow.datasets import SampleData
```

In [30]:
```
sample_users, sample_items, sample_ratings = SampleData(users, items, ratings)
```

Preprocessing

Encoding

- Label Encode: Index the User and Items => They can be string, unique values,

Train and Test Split

- Random Split
- Stratified Split
- Chronological Split

In [33]:
```
from recoflow.preprocessing import EncodeUserItem
```

In [35]:
```
interaction, n_users, n_items, user_encoder, item_encoder = EncodeUserItem(sample_ratings,
                                                                           "user_id",
                                                                           "movie_id",
                                                                           "rating",
                                                                           "unix_timestamp")
```

```
Number of users:  10
Number of items:  6
```

In [36]:
```
interaction.head()
```

Out[36]:

	user_id	movie_id	RATING	TIMESTAMP	USER	ITEM
